EXPERIMENT 8 – INTERACTIVE DASHBOARD USING TABLEAU

AIM

To create an interactive Tableau dashboard from Sample – Superstore showing Sales by Category, Sales trend over time, and Profit versus Sales by Sub-Category, with filters and dashboard actions.

ALGORITHM

1. Connect Tableau to the Sample – Superstore dataset.
2. Bar chart: Category on Columns, SUM(Sales) on Rows, Region on Color, labels enabled, descending sort.
3. Line chart: Order Date as continuous Month on Columns, SUM(Sales) on Rows, Region on Color.
4. Scatter plot: SUM(Sales) on Columns, SUM(Profit) on Rows, Sub-Category on Detail, Category on Color.
5. Create a dashboard titled Sales Dashboard and arrange line chart on top, bar chart bottom-left and scatter plot bottom-right.
6. Show Region/Category/Year filters.
7. Add a Filter Action from the bar chart to the line and scatter plots; optionally add a Highlight Action.
8. Publish to Tableau Public or export as PDF/Image.

PROGRAM

This experiment is carried out in Tableau’s graphical interface rather than in Python. The steps in the algorithm above were followed and the workbook was saved.

OUTPUT

Bar chart: Sales by Category, coloured by Region, with labels; line chart of the Sales trend; Profit vs Sales scatter plot by Sub-Category; combined into the Sales Dashboard with filters and actions.

RESULT

Thus, an interactive Tableau dashboard is created to explore sales and profit patterns using charts, filters and dashboard actions.
